

Description of the method

Description:	trim method returns a copy of the string for which the method is executed with leading and trailing white space removed.
Available for:	string
Parameters:	-
Return type:	string

Example

Context:	HeaderType1
OCL:	self.Id.trim() = "IdContent"
Description:	The example rule executes trim to the <Id> element and compares the result to a string "IdContent".

The XML snippet below would pass this check. The example has some leading and trailing white space which gets removed and after that a string "IdContent" is left.

```
<Id> IdContent </Id>
```

The other snippet below however would not pass this check. The whitespace inside a string is left untouched.

```
<Id>Id Content</Id>
```

Attached you can find example schema and files which you can use for testing.
