

## Description of the method

<b>Description:</b>	xmlDataSize method checks the combined length of child element values. This method is for some special purposes where only the data length matters.
<b>Available for:</b>	any
<b>Parameters:</b>	-
<b>Return type:</b>	integer

## Example

<b>Context:</b>	HeaderType1
<b>OCL:</b>	self.xmlDataSize() = 24
<b>Description:</b>	The example rule checks the combined length of element values from PartyIdentification child elements.

The XML snippet below would pass this check.

```
<Header>
  <Id>aId</Id>
  <TimeStamp>2015-07-03T12:17:50</TimeStamp>
  <ControlSum>2</ControlSum>

  <NumberOfTransactions>1</NumberOfTransactions>
</Header>
```

The following data is taken into account when calculating the length in the above example "aId2015-07-03T12:17:5021". So elements and pretty printing is removed and only the data is left for the length calculation.

Attached you can find example schema and files which you can use for testing.
