

Description of the method

Description:	.encoding() method returns the value of encoding attribute from the XML declaration. The method can be used for any context, but it always check the XML declaration.
Available for:	any
Parameters:	-
Return type:	string

Example

Context:	Message
OCL:	self.encoding() = "UTF-8"
Description:	The rule is checking if the value of the encoding attribute in XML declaration is "UTF-8". If it's not, an error will be given.

The XML snippet below would pass this check.

```
<?xml version="1.0" encoding="UTF-8"?>
```

The other snippet below however would not pass this check.

```
<?xml version="1.0"?>
```
